Operational Readiness through Infrastructure Observability

- Framework and Guardrails to prevent application failures
- Optimize utilization of our limited On-Premise Infrastructure resources

From Fragmented Monitoring to Operational Readiness

Establishing shared visibility, consistent governance and faster action across Platform.

BEFORE			AFTER	
Current operating reality	**Operational risk**		**Proposed solution**	**Expected Outcome**
Fragmented monitoring — No unified view of infrastructure health and resource consumption.	Blind spots in readiness, capacity and emerging issues.	→	Unified observability dashboards.	**Situational awareness** — A common operating picture.
Centralised expertise — Teams depend on platform specialists for monitoring.	Slower response and limited scalability.	→	AI-assisted, self-service dashboards.	**Operational agility** — Faster, independent action.
Inconsistent standards — Teams use different metrics and dashboard practices.	Weak oversight, inconsistent reporting, high mental overheads.	→	Approved templates and automated deployment (IaC).	**Command and control** — Consistent governance and enterprise oversight.

Monitoring depends on central specialists

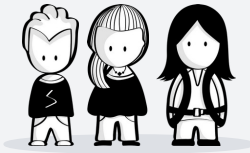

PLATFORM ENGINEERING TEAM

Non-standard dashboards = mental overhead; have to hand hold application teams

TEAM-SPECIFIC VIEW A
Different metrics and dashboard definitions

TEAM-SPECIFIC VIEW B
Separate configuration and maintenance

TEAM-SPECIFIC VIEW C
Uneven visibility across workloads

APPLICATION DEVELOPMENT TEAMS

Tendency to create single-use dashboards

Result: Limited Observability • Central Bottlenecks • Mental Overhead

OPENSHIFT + ACM + GRAFANA

Existing infrastructure and monitoring foundation — retained in both models

OPERATING MODEL | PROPOSED FUTURE STATE

AFTER

Moving towards a self-service model

A model that provides standardization with flexibility and oversight

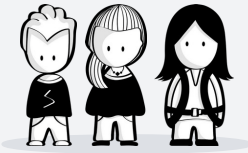

PLATFORM ENGINEERING TEAM

Sets standards • Paves golden paths

TOOLS

- Golden dashboard templates
- Infrastructure as Code
- AI Agent Skills

APPLICATION DEVELOPMENT TEAMS

Empowered to monitor their own applications while ensuring standardization

DISCOVER
Find approved dashboards

REUSE
Start from golden templates

VALIDATE
Check against standards

Human review

DEPLOY
Version and publish

OPENSHIFT + ACM + GRAFANA

Existing infrastructure and monitoring foundation — retained in both models

Framework: Operational Maturity Levels

L0

Explore

(Does it work?)

Rapid prototyping and POCs

L1

Operate

(Does it work well?)

Production grade, operational. Observability and monitoring are essential.

L2

Assure

(Does it meet the minimum operational standards? Availability, reliability)

SLO, SLA, operational runbooks for every alert. Enforce quality.

Recap

Framework: Operational Maturity Levels

Fragmented Monitoring	→	L1 maturity to enforce per-system monitoring
Centralised Expertise	→	Guided self-service onboarding towards L1 maturity. Policy-as-Code verifiable.
Inconsistent Standards	→	Agent skill with embedded standards. Automated conformance checks with Git workflows.
